*Note

As I mentioned earlier, we are not focusing on any language specific details/ feature in this course. Meaning, whatever we are discussing here is common for all the programmers. As an instructor, I should make you comfortable to understand the concept which we are going to discuss in this course. So I need some programming language to explain the concepts. So, in this course, I have chosen **Java**.

Since we are going to focus only on logic to implement data structures or logic to implement best way to do the things (basically algorithms), you can just relate the logic with the programming language which is you are already familiar with. Due to that reason, **In this course, I am not writing the code line by line. If we do that, It would be like more specific to Java language and also It will hurt other language programmers. So we will take the code which is written already in Java and discuss the implementation approach for that specific data structures or algorithms**..
